

Highlights of STK

- Sleek design in MS for industrial usage with a small footprint.
- Touch Screen based system with a touch pad & Keyboard .
- Quick program generation with audio, video & images.
- Local language support for Hindi, Tamil and other languages supported under Unicode.
- Program evaluation module with facility to generate completion certificates with photographs.
- Emergency Evacuation module with graphical display.
- Photograph & Finger print scanning for enhanced safety.
- Integration to access control & other system possible at additional cost.
- Sample programs for various industries.
- Risk & PPE matrix
- Hazard & First AID matrix

Safety is a matter of concern for every industry today. Because of the complex work environment and Compliances there is always a need for safety & security training.

Though it is humanly impossible to avoid every untoward incidence, preparedness & continual training is the best path forward. Classroom training via trainer is the best method for safety training but it is a method which is very time & resource consuming. Besides for Visitors, Contract Workers, Apprentices etc organizing a classroom is challenging. Evaluation of the training is an important aspect of any safety training and so is the documentation that need to be maintained for the Safety audits.

STK : Safety Training Kiosk can help you in overcoming various issues associated with safety training and streamline the end to end process.

STK is a Touch screen based kiosk with audio & video support. With programs in vernacular languages like Hindi, Tamil, Marathi etc. and watching the video & audio users can be trained in a short time. STK has an evaluation module which helps in ascertaining the effectiveness of the safety training.

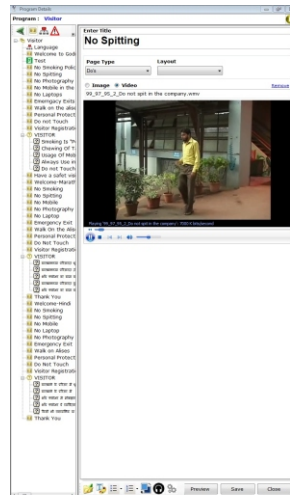

STK software has three main functionality

- Safety Training Program Creation
- Safety Program demonstration
- Safety Training Evaluation & Safety Permit

Safety Training Program Creation

STK is ready with many training programs & templates which are based on Industry Best Practices. One can cut & paste and customize the program as per the need.

It is also possible to generate the new programs with a Program Generation Kit by capturing actual process videos & voice over.

The Emergency Evacuation module can be used to train about the assembly points, hazardous areas, material etc. The details of evacuation drills etc. can be incorporated in the evacuation module.

STK also provides the Risks & PPE matrix and Hazard & First AID matrix. Once these masters are generated, using them in the program becomes very simple.

Safety Program Demonstration

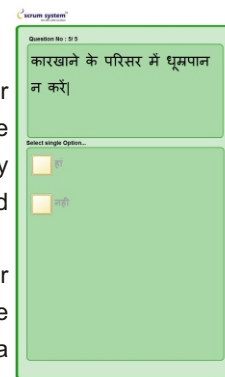

Usually STK is placed in self play mode at the reception / safety training room. The interactive menu helps the user navigate through the safety program in the chosen language. STK would display the Audio & Video program in the local language like English, Marathi and Hindi etc.

The user gets the opportunity to repeat a slide which is not understood properly. Because the audio, video and images (photographs) user can learn quickly.

Safety Training Evaluation

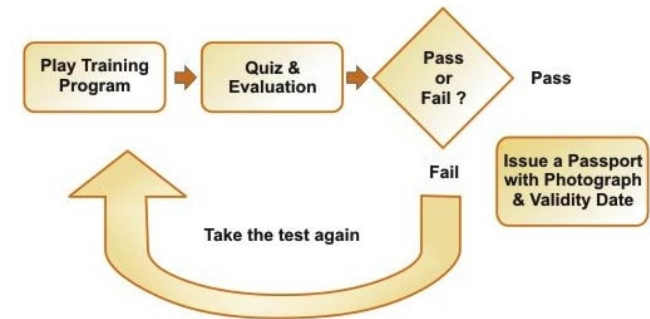

STK helps in uploading questions for evaluation of the safety training. One can create a question bank of many questions and can ask selected question in random order.

Minimum score can be setup for passing the exam and the candidate can take the exam again in case of a failure.

On successful completion of the examination, a photograph of the candidate is taken, followed by the Finger print (optional). A safety permit can be issued to the candidate which will have the photograph and other relevant details of the individual.

Safety Training Evaluation Flow Chart

In many organizations issue a safety permit before under taking any maintenance work in the plant. STK offers a facility to create the questionnaire for the safety permit and subsequent evaluation.
